NSW BIODIVERSITY CREDIT MARKET · GAP ANALYSIS

Refresh Guide

Likitha Vankadoth · Data: DCCEEW Biodiversity Offsets Scheme registers, extracted 5 Oct 2026

How to update the analysis and dashboard with new data from DCCEEW. It takes about 15 minutes.

1. Download the latest registers

Open each link in a browser. Each one downloads an `.xls` file.

Register	Download link	Save as
Credit Supply	https://customer.lmbc.nsw.gov.au/application/BOAMCreditSupplyRegisterExport	`data/raw/Supply.xls`
Credit Demand	https://customer.lmbc.nsw.gov.au/application/BOAMCreditDemandRegisterExport	`data/raw/Demand.xls`
Credit Transactions	https://customer.lmbc.nsw.gov.au/application/BOAMCreditTransactionSaleRegisterExport	`data/raw/Transactions.xls`

The links come from the BOS public registers page. If they stop working, use the "point-in-time Excel download" link on that page.

Replace the old files. Keep the exact file names above.

2. Run the pipeline

From the project folder:

```
python src/readers.py         # optional check: prints row counts for the 3 files
python src/clean.py
python src/gap_analysis.py
python src/price_trends.py
python src/export_powerbi.py
```

3. Check the data quality log

Look at the table that `clean.py` prints, or open `data/processed/data_quality_log.csv`. Compare it with the previous run:

- Large jumps in dropped rows may mean DCCEEW changed the file layout.
- If a script fails with a `KeyError`, a column was probably renamed. Update the column name in `src/clean.py`.
- If the demand register now has rows, consider adding it as a second demand measure.

4. Update Power BI

1. Sign in at app.powerbi.com and open **My workspace**.
2. Open the **BOS Credit Market** semantic model and replace the data with the new `outputs/powerbi_data.xlsx` (upload it again through **Create → Excel → Upload file**, using the same semantic model name).
3. Open the **BOS Credit Market Dashboard** report and check that the cards and table updated.
4. Take new screenshots for `outputs/` and update the date and figures in the README.

5. Save to GitHub

```
git add -A
git commit -m "Refresh with registers extracted <DATE>"
git push
```

This uploads the new raw exports in `data/raw/` and the re-created files in `data/processed/` along with the code and outputs, so the repository always matches the latest extraction.
